CHANDIGARH UNIVERSITY

Discover. Learn. Empower.

Subject: Front End Technologies

Subject code: 25CAH-655

Assignment No.: 1

Student Name: Roshan Kumar Singh

UID: 25MCA20067

Branch: MCA (Gen)

Section/Group: 25 MCA_KAR_1

Submitted to: Prof. Juned Alam

Date of Submission: 07-02-2026

Q.1 What is Figma? Explain its key features and why it is widely used in modern UI/UX design.

Ans :- Figma is a cloud-based UI/UX design tool used to create user interface for websites, mobile apps, and software products. It works directly in the browser, so no heavy installation is required. One of its main features is real time collaboration, where multiple designers can work on the same file simultaneously. Figma also supports vector based design, making layouts sharp and scalable. Designers can create wireframes, UI screens, and interactive prototypes in one place. Because designs are stored online, sharing links with teams and clients becomes very easy. These features makes Figma fast, collaborative, and ideal for modern UI/UX workflows.

Q.2. Differentiate between Designing and Prototyping in Figma. Explain with one real world example.

Ans:-

Basis	Designing	Prototyping
1) Purpose	To define the visual language, layout, and structure of the application or website.	To validate early concepts, test user experience (UX), and showcase functionality to stakeholders without writing code.
2) Action	Creating frames, drawing vectors, using Auto layouts, setting typography, applying colors, and building components.	Connecting frames with wires, setting triggers (Click, hover), configuring actions and adding animations.
3) State	Static, The designs do not move or respond to interaction.	Interactive, Users can click through screens to navigate.

For example, Suppose in a food delivery app, designing includes making the home screen, food cards, and orders button visually attractive.

prototyping connects the "Order Now" button to the payment screen to simulate real app behaviour. Both are essential for a complete UI/UX process.

Q.3. What are Components and Styles in Figma? How do they help in maintaining consistency and saving time in large projects?

Ans:- Components in Figma are reusable design elements, such as buttons, navigation bars, or cards, that can be used multiple times across a project. When the main component is updated, all its instances update automatically.

Styles are predefined settings for colors, text, and effects, ensuring uniform design throughout the project. They help maintain visual consistency, especially when multiple designers work together.

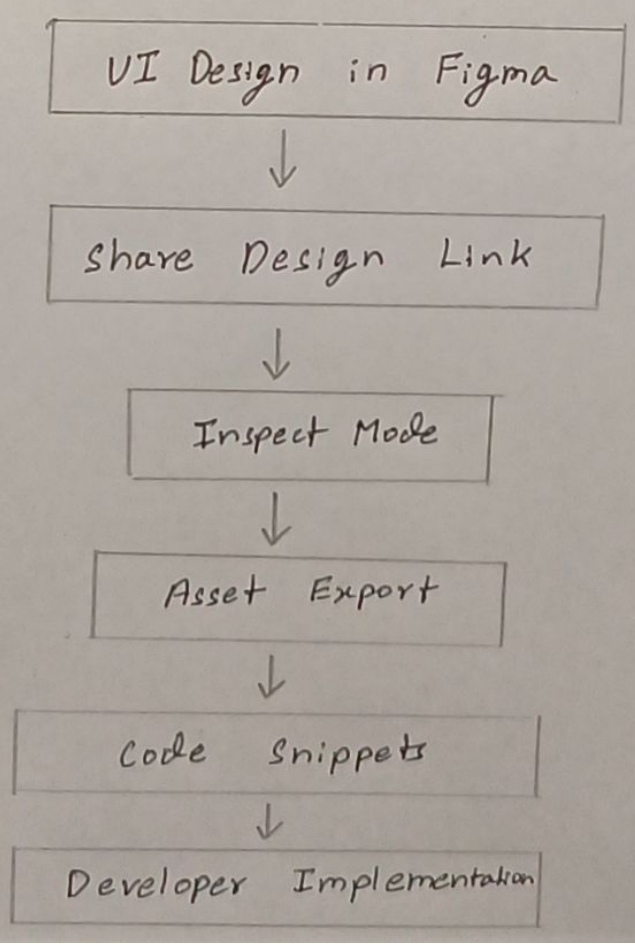
In large projects, components and styles reduces repetitive work and design errors. Designers can make global changes quickly instead of editing each screen manually. This saves time and improves design quality.

Q.4 Explain Auto-Layout in Figma? How does it help in creating responsive designs for different screen sizes.

Ans:- Auto Layout is a powerful features in Figma that automatically adjusts spacing, padding, and alignment of elements inside a frame. It allows designs to resize smoothly when text length or screen size changes. With Auto layout designers can build, buttons, lists, and cards that grows or shrink dynamically. This is especially useful for responsive designs across mobile, tablet, and desktop screens. It reduces manual resizing work and keeps layouts well-structured. Auto Layouts helps designers think like developers while designing UI.

Q5. Describe the complete developer handoff process in Figma. How are designs shared, assets exported, and code snippets generated for developers?

Ans:- Developer Handoff Process in Figma.



The developer hand off process in Figma starts by sharing the design file link with developers, giving them view or inspect access. Developers can select any UI elements to see its size, spacing, colors and typography details. Figma easy exporting of assets like icons and images in formats such as PNG, SVG, or JPG. Code snippets for CSS, iOS and Android are automatically generated in the Inspect panel. This reduces communication gaps between designers and developers. As a result, development becomes faster and more accurate.
